October 2014

The Honorable Mark Dayton Governor of Minnesota 130 State Capitol 75 Rev. Dr. Martin Luther King Jr. Blvd. St. Paul, MN 55155

Dear Governor Dayton:

The Minnesota Department of Public Safety State Fire Marshal Division is pleased to present for your review the 25th edition of our annual report, *Fire in Minnesota 2013*.

Provided by more than 770 Minnesota fire departments, this data allows us to analyze fire causes and determine the best methods of public education and code enforcement to improve fire safety and prevent fires in our state.

Minnesota fire departments have been reporting data online since 2009. In 80 of Minnesota's 87 counties, 100 percent of fire departments reported 2013 data. Statewide, 99 percent of Minnesota fire departments provided numbers for this report, illustrating their commitment to fire prevention and making Minnesota a national leader in fire data collection.

Here are a few highlights from Fire in Minnesota 2013

- There were 44 fire deaths last year a 12 percent decrease from 50 deaths in 2012
- Careless smoking and cooking were the most common causes of fatal fires
- Cooking, heating and open flame were the most common causes of structure fires
- 73 percent of fatal fires occurred where people generally feel safest at home

The Department of Public Safety remains committed to protecting Minnesotans' lives and property. This report is created to that end by the dedicated members of the State Fire Marshal Division with data from hundreds of Minnesota fire departments.

Respectfully,

Ramona L Dohman

Commissioner Ramona L. Dohman

EQUAL OPPORTUNITY EMPLOYER

From the State Fire Marshal

Welcome to the 25th-anniversary edition of the Fire in Minnesota report.

This year's report has a new look. There are more photographs, a new cover and other cosmetic changes. We did away with some of the dated material and images, added color and included photos of our staff — and Minnesota fire service members — hard at work. We hope these changes make *Fire in Minnesota* a better tool and a more enjoyable read. In honor of *Fire in Minnesota*'s 25th birthday, let's take a stroll down memory lane.

In 1989 — the report's first year — there were two counties from which 100 percent of the fire departments provided their fire statistics. That's two counties out of 87 — not an impressive number. But the system was new, and the usefulness of the data had not yet been proven. Statewide, about 66 percent of fire departments turned in their numbers.

Twenty-five years later, 99 percent of the 785 fire departments in Minnesota reported data on emergency calls. For that, I thank you — and end our trip down memory lane. *Fire in Minnesota* today is better than ever at helping us save lives and do our jobs more effectively.

The data you provide for *Fire in Minnesota* is key to fire prevention. That was true in 1989 and it's still spot-on today. *Fire in Minnesota* shows us the facts. It shows us the trends. It shows us that people — despite how hard we try — will die in fires every year because someone was careless.

Take pride in this report. It's yours. Use it in your fire prevention efforts. Share it with your friends, your family, your elected officials and the people you serve. Spend time analyzing the information on each page so you know how to make your community safer.

My predecessors have always said — and I agree — that there are three significant causes of destructive fires. They are men, women and children. Fires are largely preventable and behavior is changeable. That's why the State Fire Marshal Division and fire departments statewide will continue their efforts to fight fire with facts.

Thank you,
Bruce West
State Fire Marshal

TOTAL IMPACT

MINNESOTA FIRE CLOCK

Frequency of Responses as Reported 2013

In 2013, 776 of the state's 785 fire departments (99 percent of all Minnesota's fire departments) reported through the Minnesota Fire Incident Reporting System (MFIRS), which collects information on fire incidents and related activities. More information about fire department participation begins on page 48.

The total number of fire incidents reported by participating Minnesota fire departments in 2013 was 13,271 — a 20 percent decrease from 2012. The number of responses by the fire service increased by three percent in 2013 to 251,609.

Structure fires continue to occur most frequently in residential property, including houses, apartments, dorms, hotels/motels, etc. In each of the last five years, an average of 4,902 fires has occurred in residential structures. These figures indicate that each year, on average, one residential structure fire occurs for every 1,061 Minnesota residents.

STRI	STRUCTURE FIRES BY PROPERTY TYPE

Barracks/dormitory	4	\$0	0	0				
Residential (other)	73	\$2,620,161	1	0				

The 2013 dollar loss in residential property increased by \$11.8 million from 2012 while total dollar loss decreased more than 22 percent.

Residential fires accounted for 76 percent of all structure fires and 54 percent of total dollar loss.

The average dollar loss per structure fire in 2013 was almost \$32,000 per incident. The average dollar loss per residential structure fire was more than \$24,000 per incident.

DOLLAR LOSS BY PROPERTY TYPE (in millions)

^{*} Includes one \$78 million manufacturing plant fire and one \$14 million manufacturing plant fire.

^{**} Includes one \$10 million warehouse fire.

^{***} Includes on \$6 million grain elevator fire.

In 2013 there were 78 sprinkler saves in Minnesota. This means that every month in Minnesota, there were six to seven fires extinguished by automatic fire sprinkler systems. These sprinkler activations saved 78 buildings from devastation by fire, minimized property loss, greatly reduced business interruption, and potentially saved lives.

Residential Occupancies Where Smoke Alarms Activated

Summary

A slight decrease in reporting by Minnesota fire departments brought the total number reporting

to 776 (99 percent) of 785 departments.

The total number of calls increased 3 percent from 2012. Dollar loss was more than \$229 million.

Fires occurred most frequently in residential-type properties.
Residential fires occurred in significantly higher percentages than fires in the next most

reported property type — storage facilities. Residential fires accounted for 76 percent of all structure fires, 54 percent of total dollar loss, and 94 percent of all structure fire deaths. These statistics continue to identify the home as the most dangerous place to be.

In the last 25 years, more than \$4.1 billion in property was destroyed by fire; 49 percent, or nearly \$2 billion, occurred in residential property.

Looking at the past five years of fires in all types of building fires (2009-2012), cooking is undoubtedly the leading cause. Heating and open flame are the second and third leading cause respectively when compared with all known causes.

Cooking is the leading cause mainly due to contained cooking fires. The open flame category includes matches, candles, cigarette lighters, charcoal lighters and flares.

Fires in residential property represented 76 percent of all structure fires and 54 percent of the total dollar loss. Sixty-four percent of incendiary fires occurred in residential properties, causing almost \$5 million in property loss.

STRUCTURE FIRE CAUSES (2008-2012)

Cooking Fires

The leading cause of structure fires in 2013 was cooking. Eighty-nine percent of those fires were contained cooking fires.

The top three known factors in the remaining cooking fires were: unattended equipment at 28 percent, combustibles too close at 11 percent and equipment accidentally turned on/not turned off at 9 percent. There were six cooking-related civilian fire deaths and 51 civilian injuries as well as 10 firefighter injuries. Dollar loss from cooking fires in 2013 totaled \$5,937,582.

Heating Fires

The majority of 2013 heating-related fires (464) occurred in residential properties.

These fires increased 25 percent from last year — there were 372 fires heating-related fires in 2012 — and dollar loss increased by more than 8 percent.

Summary

In the past five years, cooking caused the largest percentage of structure fires (48 percent) with heating and open flame as the second and third leading causes. Cooking, heating and open flame accounted for 68 percent of total structure fires with known causes. Fires in residential spaces represent 76 percent of all structure fires and 94 percent of fire deaths in structures.

Seventy-four percent of civilian injuries occurred in residential fires.

While careless smoking accounts for only 4 percent of structure fires, it nevertheless caused 23 percent of known fire fatalities and 19 percent of residential fire deaths.

In the past five years, fire departments reported 10 percent of all structure fire

causes as "other causes." Fire departments are strongly encouraged to provide the maximum available information on MFIRS reports. Lack of information increases the number of incidents with "other" listed as cause. In order to focus our fire prevention efforts where the greatest need exists, complete reporting of causes/ignition factors in the MFIRS program is essential. Minnesotans continue to be in the greatest danger from fires in their own homes. Fire prevention efforts in the areas of cooking and heating must continue to be a top priority for the fire service.

Fire Prevention Week

Since 1925, the week of Oct. 9 has been designated Fire Prevention Week in the United States in memory of the Great Chicago Fire of Oct. 9, 1871. The National Fire Protection Association for more than 85 years has sent a special fire-prevention message to the public during Fire Prevention Week.

The SFMD urges Minnesota fire departments to implement the safety theme and lead fire prevention efforts in their communities. More information about Fire Prevention Week is online at <u>National Fire Protection Association</u>

There were 918 identified incendiary fires in 2013, a 31 percent decrease from 2012.

Incendiary refers to any intentionally set fire. An arson fire is an example of an incendiary fire, but not all incendiary fires are arson. Incendiary fires may also include recreational fires intentionally set that get out of control. The value of property destroyed by incendiary fires in 2013 was approximately \$6 million, a 48 percent decrease from 2012. Both numbers are considerably lower than those in the 1990s.

Number of Incendiary Fires

- Vehicle: 106 (12 percent)
- Structure: 267 (29 percent)
- Other: 545
 (59 percent)

Sixty-four percent of incendiary fires reported were in residential structures. Dollar loss in those properties was more than \$5 million, or 84 percent of incendiary dollar loss in structures.

INCENDIARY FIRES BY STRUCTURE TYPE

INCENDIARY DOLLAR LOSS

On average for the past 5 years, incendiary was listed as the cause of 8 percent of all reported structure fires with known causes and 4 percent of all reported vehicle fires in Minnesota.

Vehicle incendiary dollar loss represented 3 percent of total vehicle fire dollar loss with an average dollar loss per incendiary vehicle fire of \$4,591

Fire investigators agree that incendiary vehicle fires are under-reported and may not receive as much attention as structure fires receive.

STRUCTURE AND VEHICLE INCENDIARY FIRES

Residential structures are at greatest risk from fire. These same structures are also at greatest risk from incendiary fires.

The 170 residential incendiary incidents reported in 2013 accounted for 4 percent of all reported residential fires and 4 percent of the dollar loss for this property type.

Arson Tip Line

Do you have a tip or information about a possible arson fire? Call the Arson Hotline at 1-800-723-2020. Rewards are possible for information leading to the identification of persons responsible.

Rewards are as follows:

An **extraordinary reward of \$2,000 to \$5,000** for information or assistance that leads to the arrest of person(s) on a charge of arson.

An **information reward** of up to \$2,000 for information in a meritorious situation with no requirement that the information lead to an arrest.

A **lesser reward** for useful Information which could prevent an incendiary fire or aid in catching a person who set one. There is no requirement that the information lead to an arrest.

In some instances, the protection district of the reporting fire department goes beyond its county boundary, but the incident is recorded within the department's home county.

Summary

Incendiary fires and dollar loss decreased in 2013. On a five-year average, incendiary fires were the cause of 8 percent of structure fires with known causes.

In 2013, 64 percent of all incendiary structure fires were in residential property as well as 84 percent of all incendiary dollar loss.

In the past 25 years, incendiary fires caused 59 deaths and more than \$351.8 million in property loss.

Incendiary fires must continue to be addressed through efforts such as the Arson Reward Program and the Youth Firesetter Intervention and Prevention Program.

Fire in Minnesota: Documenting the Past, Improving the Future

The fire service and its history are inseparable. Few institutions have as keen a grasp of how our history has shaped our future. Since its establishment in 1905, the Minnesota State Fire

Marshal Division has worked to pass along the lessons learned in over 100 years of fire prevention experience.

Spanish philosopher George Santayana said, "Those who cannot remember the past are condemned to repeat it." By compiling and making available a resource like the book you're holding, the State Fire Marshal Division hopes to help the public learn from the past and develop safe behaviors for the future.

This year is the 25th anniversary of the *Fire in Minnesota* report. Since the first report, fire department participation has risen dramatically from just 66 percent of fire departments reporting to more than 99 percent participation today. This unique level of voluntary support from Minnesota fire departments allows local, state and federal officials to monitor and react to Minnesota's changing fire prevention needs. Additionally, a comprehensive picture of the incident numbers, causes and casualties allows the fire service to see what works and what does not.

The last quarter-century of data tells the story of constantly evolving circumstances, and reflects the need for changing strategies to prevent fires and save lives. For example, 25 years ago, heating was the number-one cause of structure fires in our state. Today, cooking fires are the number-one cause, accounting for nearly half of Minnesota's structure fires.

The report also shows us that fires have become less frequent. In the first report, fire departments reported nearly 20,000 fires. Today, *Fire in Minnesota* reflects the declining trend in the number of reported fires to more than 13,000 in 2013.

Statistics can also show us where technology and behavior make a positive difference. We see that smoke alarms save lives. Good data, over time, will also reveal the way that technology — like residential sprinkler systems — help decrease destruction and increase the likelihood of saving lives.

The State Fire Marshal Division is proud to reach this 25-year milestone. We look forward to another 25 years of reports detailing the continuing decline of fires and fire deaths in Minnesota. By documenting our past and applying the lessons we learn, Minnesota is on a path to creating a safer state for everyone.

In 2013, 44 civilians died in Minnesota fires. This number represents a 12 percent decrease in fire deaths compared to the 2012 total of 50 fatalities. Residential fire deaths represented 73 percent of total fire deaths in 2013. In 12 percent of the residential casualties, smoke alarms were absent or non-operating. In 58 percent of residential fires, it was not possible to determine whether a smoke detector was present or operating.

Nine Deaths in Homes With Working Smoke Alarms: Why Didn't They Get Out?

Mental health issue: 1

Smoking with oxygen tank nearby: 1

Medical issue: 1

Intoxication: 4Unknown: 1

Hard of hearing: 1

All charts and information on this page have been taken from the SFMD's 2013 fire death database, which is based on fire death investigations done by this office and on MFIRS data.

Civilian Fire Deaths

Fifty percent of fire deaths in 2013 occurred between the hours of 6 a.m. and 6 p.m.

Thirty-nine percent of the fire deaths occurred in October through December only.

In 2013, total fire deaths decreased by 12 percent from 2012.

Deaths in the 0-19 age group decreased by 200 percent. The 20 to 39 year-old and 40 to 59 year-old groups stayed the same. Fire deaths among people 60+ years of age decreased 29 percent, but that age group still had the largest number of fire deaths in 2013 (20).

FIRE DEATHS BY TIME OF DAY

Civilian Fire Deaths: Where and Why?

Seventy-three percent of all 2013 fire deaths occurred where people generally feel safest — in their homes — and 94 percent of structural fire deaths were in residences. In 2013, careless smoking and unattended cooking were tied for the leading cause of fatal fires. Alcohol or drug use was a factor in 33 percent of the careless smoking deaths and in 36 percent of all fire deaths.

Civilian Deaths: 1990 through 2013

In the past 24 years, 1,222 civilians have died in fires. In 2013, 46 percent of our state population lived in greater Minnesota, where the per capita fire death rate was 1.21 deaths for every 100,000 people. The per capita fire death rate for the metro area in 2013 was 0.47 per 100,000, while the rate for the state as a whole was 0.81 per 100,000. That compares favorably to the national per capita fire death rate, which was 0.9 per 100,000. There are three Minnesota counties that have remained fatality free for the past 24 years: Traverse, Stevens and Murray.

30-plus Years of Fire Death History

As Minnesota's population has grown from 3.8 million in 1970 to 5.4 million in 2013, fire deaths have decreased. During the 1980s, fire deaths in Minnesota dropped 19 percent from the levels of the 1970s. The 1990s showed a further decrease of 25 percent from the levels of the 1980s. The 2000s had a decrease of 21 percent from the 1990s.

Much of this decline in the fire death trend can be attributed to fire service advancements. Since the mid-seventies, the promotion of fire protection technology (smoke alarms, sprinkler systems, etc.) has become widespread in Minnesota.

Also during this time, the state has mandated new inspection and code enforcement programs targeting hotels, motels, schools, and health and day-care facilities.

Firefighter Deaths

The Minnesota Fire Service mourns the loss of one of its members in 2013. Rice Lake Fire Chief Matt Frantz suffered a heart attack after a mutual aid response on Dec. 9.

In 2013, a total of 97 on-duty firefighter deaths occurred in the United States. This is a sharp increase from the 64 on-duty deaths in 2012 and 61 on-duty deaths in 2011. We honor those who have fallen and remember them with pride and gratitude for their dedicated service in protecting their fellow citizens.

Firefighter Injuries

In 2013, 290 Minnesota firefighters were injured on the job — a 7 percent drop from 2012. Of these injuries, 159 (55 percent) were fire-related. Sixty-four percent of these fire-related injuries occurred while firefighters were fighting residential structure fires (102). Of known causes, overexertion was the most common (32 percent) with fall/jump/trip as the next highest at 27 percent.

Civilian Injuries Reported by Fire Departments

In 2013, 109 civilian injuries were reported through the MFIRS system, a 9 percent decrease from 2012.

This number does not represent the actual number of fire injuries occurring in the state, as it includes only those victims who have direct contact with a fire department. Contact the Minnesota Department of Health for more information on burn injuries reported to hospitals.

CIVILIAN								
ı	INJURIES							
AGE	NO. OF VICTIMS							
0-19	13							
20-39	37							
40-59	34							
60+	25							
TOTAL	109							

Many burn victims are taken to emergency rooms by private car or ambulance. A breakdown of reported injuries by gender shows that 65 percent of injuries were to males and 35 percent to females.

People trying to control a fire accounted for 23 percent of all civilian fire injuries. These numbers indicate an ongoing need to educate citizens of all ages on how to react to a fire. "Get Out and Stay Out" cannot be over-emphasized.

CIVILIAN INJURIES BY ACTIVITY

CIVILIAN INJURIES BY PROPERTY TYPE

Fireworks Property Loss

The State Fire Marshal Division has gathered information about fireworks injuries and property damage since 1989. Minnesota hospitals voluntarily report injuries treated in their emergency departments during the period of June 25 to July 15 each year.

Property damage information is taken from the Minnesota Fire Incident Reporting System. From 1989 through 2001, a total of \$1.6 million in property damage resulting from fireworks use was reported, averaging more than \$123,000 per year. The total property damage due to fireworks use from 2002 through 2004 was over \$3 million. Property damage reported from 2009 through 2013 totaled nearly \$600,000, averaging more than \$117,000 per year.

^{*} Information taken from the Minnesota Fire Incident Reporting System (MFIRS).

Fireworks Injuries

Fireworks injuries most commonly occur to males between one and 19 years of age, with burns being the most common type of injury reported. Burn injuries include those to the extremities, eyes, and face. It is impossible to know how many injuries occurred for which medical attention was not sought. Approximately 85 percent of Minnesota hospitals participate in the survey of fireworks injuries.

^{*} Information collected from a Minnesota hospitals survey covering June 25 through July 15 annually.

^{**} There was one injury in 2011 that listed age as "unknown" or "0."

Summary

Historically, Minnesotans have been at greatest risk of fire death and injury in their own homes. In 2013, 73 percent of fire deaths and 74 percent of civilian injuries occurred in residential settings. Ninety-four percent of structural fire deaths were in residential property. The presence

or absence of working smoke alarms is often a factor in fire fatalities. In 12 percent of fire deaths occurring in dwellings, smoke alarms were not present or not working. In 58 percent of residential deaths, it was not known whether alarms were present or functioning.

Careless smoking and unattended cooking are tied for the leading cause of fire deaths in 2013, representing 46 percent of known causes. Alcohol or drug use was an impairing factor in 36 percent of all fire deaths.

Total fire deaths decreased by 12 percent from 2012; the youngest age group (0-19 years) increased by 200 percent in

2013 and the 20-39 year age group stayed the same as well as the middle age group (40-59 years). The 60+ group went down by 29 percent and represents the largest number of all fire fatalities from 2013.

MINNESOTA'S
FIRE DEATHS

DECADE DEATHS

1970s 961
1980s 776
1990s 585
2000s 465
2010s 473
(estimate)

Twenty-three percent of civilian fire injuries occurred during attempts to extinguish the fire, indicating a continuing need to educate our citizens on fire-safe behaviors in the home. Getting out as quickly as possible, and not re-entering the home once outside, must be emphasized in all age groups.

Fifty-five percent of firefighter injuries took place while fighting fires; 64 percent of these firerelated injuries occurred at residential structure fires.

Overall, fire deaths have decreased over the past 30 years in Minnesota, even as the population has grown. However, many preventable tragedies continue to occur. Prevention and education efforts, particularly those targeting vulnerable populations, are essential to reduce losses from fire.

Minnesota Fire Incident Reporting System

The Minnesota State Fire Marshal Division appreciates the efforts of the fire departments that submitted data via the Minnesota Fire Incident Reporting System (MFIRS) in 2013.

This information is essential if we are to understand and effectively combat the fire problem in Minnesota. It allows the division to focus on real fire problems, rather than popular perceptions. On the local level, this data provides information to help focus on prevention efforts; it also assists with budget planning for staffing and equipment.

Fire data is requested on a weekly basis by the media, the public, the fire service, and the fire protection community. It is used to support legislative initiatives and to guide public fire/safety campaigns.

Information about reporting departments is listed on the following pages. In 78 counties last year, 100 percent of the fire departments reported via the MFIRS system.

In some instances, the protection district of the reporting fire department goes beyond its county boundary, but the incident is recorded within the department's home county. The fire rate equals one fire per number of persons indicated. For example, in Aitkin County in 2013, there was one fire for every 314 people.
