

2016

FIRE IN MINNESOTA

STATE FIRE MARSHAL

The mission of the State Fire Marshal Division is to protect lives and property by fostering a fire-safe environment through investigation, enforcement, regulation, data collection and public education.

FIRE IN MINNESOTA

The Minnesota Department of Public Safety State Fire Marshal Division

Statistical data pertaining to all fire-related incidents
in the state of Minnesota for the year 2016.

2016 STATISTICS

Total Impact

Minnesota fire clock	4
Overall state totals	5
Structure fires by property type	7
Sprinkler saves	9–12

Causes

Structure fire causes	16
Where do fires start?	17–18
Incendiary fires	20

Casualties

Feature article: Structure fires, new risks and fire deaths	24–25
Smoke alarm performance	26
Civilian deaths	28–29
Fire death history	31
Firefighter deaths and injuries	33–34
Fireworks injuries and property loss	35–36

Participation

Runs, dollar loss and deaths by county	38–40
Fire department responses and dollar loss reported via MFIRS	41–61

Fire in Minnesota 2016 highlights

- 774 of Minnesota's 779 fire departments supplied fire incident data to the State Fire Marshal Division for the 2016 report.
 - This is the highest number ever of reporting fire departments.
- Fire departments responded to more incidents in 2016 than in 2015. The total increase was 6 percent.
- The number of fires in Minnesota was down by 6 percent (most of the decrease was in fires in the "other" category like grass fires, vegetation fires, outdoor fires, trash fires).
- Total dollar loss due to fires in 2016 was more than \$259 million — an increase of 16 percent from 2015.
- The number of people killed in fires in the 0-19 age category and the 60-plus age category decreased from 2015 to 2016.
 - Four people ages 0-19 died in fires in 2016 — a 56 percent decrease. Sixteen people ages 60 and over died last year — a 38 percent decrease.

From the State Fire Marshal

Arson destroys more than buildings, it can devastate a community. An arson fire can change someone's life and destroy their sense of security.

Firefighters know this. Anyone who has had their home or property intentionally set on fire knows this. Yet, arson is the type of fire that we don't hear about as much in the news.

There are logical reasons for this, of course. The leading cause of fatal fires in Minnesota is careless smoking (not arson) and unattended cooking (again, not arson) is to blame for a majority of our residential fires across the state. But consider this: There were 828 intentionally set fires in 2016 that caused \$5.7 million in damage. Those numbers are why arson is an important issue that needs to be discussed and addressed.

Our investigators do an excellent job investigating hundreds of arson fires each year. But they can't do it alone — they need information from the public. One tip could make all the difference. One tip could be the one puzzle piece that causes 25 others to come together. Those in the fire service need to continue working on building community relationships so residents feel comfortable coming forward with information. Citizens: Please don't hesitate to reach out to your local fire department or call the Minnesota Arson Hotline at 800-723-2020 if you have any information about a suspicious fire.

Fire Deaths and Residential Fires

The more things change, the more they stay the same. That old saying holds true when it comes to fires as well. Cooking remains the leading cause of residential fires in 2016. I know I sound like a broken record here but the fire service needs to keep hammering home that people need to not only stay in the kitchen while cooking but pay attention. Just like distracted driving, distracted cooking can be deadly. I urge all Minnesotans to keep an eye on what you're cooking. A tragic fire can happen in seconds.

We officially had 43 fire deaths last year in Minnesota. While that's a decrease from the 57 deaths in 2015, that number is still way too high. We all must work together to educate each other and stay safe so no family suffers the loss of a loved one in a fire.

Thank you,

A handwritten signature in black ink that reads "Bruce West". The signature is written in a cursive, flowing style.

Fire Loss in Minnesota

\$ 709,762 / Day

\$ 29,573 / Hour

\$ 493 / Minute

In 2016, 774 of the state’s 779 fire departments (99 percent of all Minnesota’s fire departments) reported through the Minnesota Fire Incident Reporting System (MFIRS), which collects information on fires and related activities. More information about fire department participation begins on page 38.

The total number of fire incidents reported by participating Minnesota fire departments in 2016 was 13,335 — a 6 percent decrease from 2015. The number of responses by the fire service increased by 6 percent in 2016 to 291,456.

2016 REPORTED FIRE DEPARTMENT RESPONSES					
Incidents Reported	Seven County Metro Area	% State Total	Balance of State	% State Total	State Total
Structure Fires	3,439	57	2,581	43	6,020
Vehicle Fires	1,271	48	1,378	52	2,649

Structure fires continue to occur most frequently in residential property, including houses, apartments, boarding houses, dorms, hotels/motels, etc. In each of the last five years, an average of 4,753 fires have occurred in residential structures. These figures indicate that each year, one residential structure fire occurs for every 1,154 residents.

STRUCTURE FIRES BY PROPERTY TYPE

Residential (other)	65	\$1,844,028	1	0
TOTAL	4,621	\$129,818,516	98	29

The 2016 dollar loss in residential property decreased slightly from 2015 while total dollar loss for all fires increased by 6 percent.

Residential fires accounted for 77 percent of all structure fires and 52 percent of total dollar loss.

The average dollar loss per structure fire in 2016 was over \$38,000 per incident. The average dollar loss per residential structure fire was over \$28,000 per incident.

DOLLAR LOSS BY PROPERTY TYPE

* Includes one \$25 million warehouse fire.

Sprinkler Saves

In 2016 there were 73 sprinkler saves in Minnesota. This means that once every five days a fire is extinguished by automatic fire sprinkler systems. These sprinkler activations saved 73 buildings from devastation by fire, minimized property loss, greatly reduced business interruption and potentially saved lives.

Smoke alarms are highly effective at alerting people of dangerous fire conditions, especially in residential occupancies where people sleep. In a high percentage of the residential fires, the smoke alarms activated and alerted the occupants. Of concern, however, are the 27 fires last year where the occupants did not get alerted to dangerous fire conditions (shown as alarm failed to alert occupants — 2 percent — or alerted occupants but the occupants failed to respond — 3 percent).

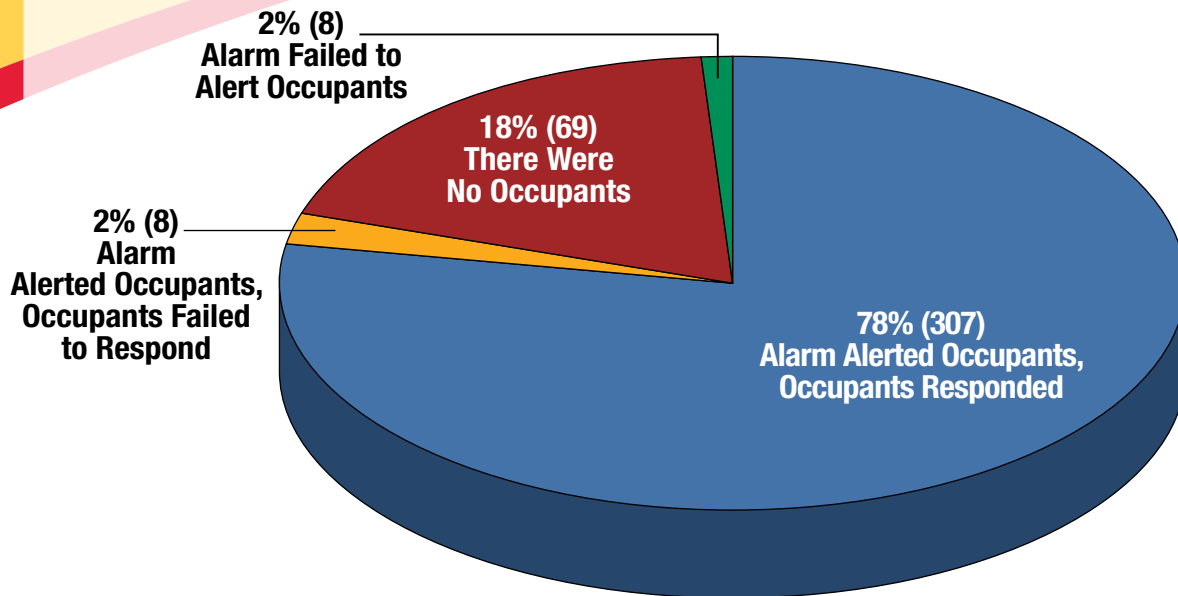

RESIDENTIAL OCCUPANCIES WHERE SMOKE ALARMS ACTIVATED — 2016

SMOKE ALARM EFFECTIVENESS — 2016

ONE/TWO FAMILY DWELLING SMOKE ALARM EFFECTIVENESS — 2016

SUMMARY

Last year, 774 (99 percent) of Minnesota's 779 fire departments reported information for Fire in Minnesota.

The total number of calls increased 6 percent last year from 2015. Dollar loss was more than \$259 million.

Fires occurred most frequently in residential properties. Residential fires occurred in significantly higher percentages than fires in the next most reported property type — storage facilities.

Fires in residential buildings accounted for 77 percent of all structure fires, 52 percent of total dollar loss and 94 percent of the fire deaths in structures in 2016. These statistics continue to identify the home as the most dangerous place to be.

In the last 28 years, almost \$4.8 billion in property was destroyed by fire; 49 percent — or over \$2 billion — occurred in residential property.

CAUSES

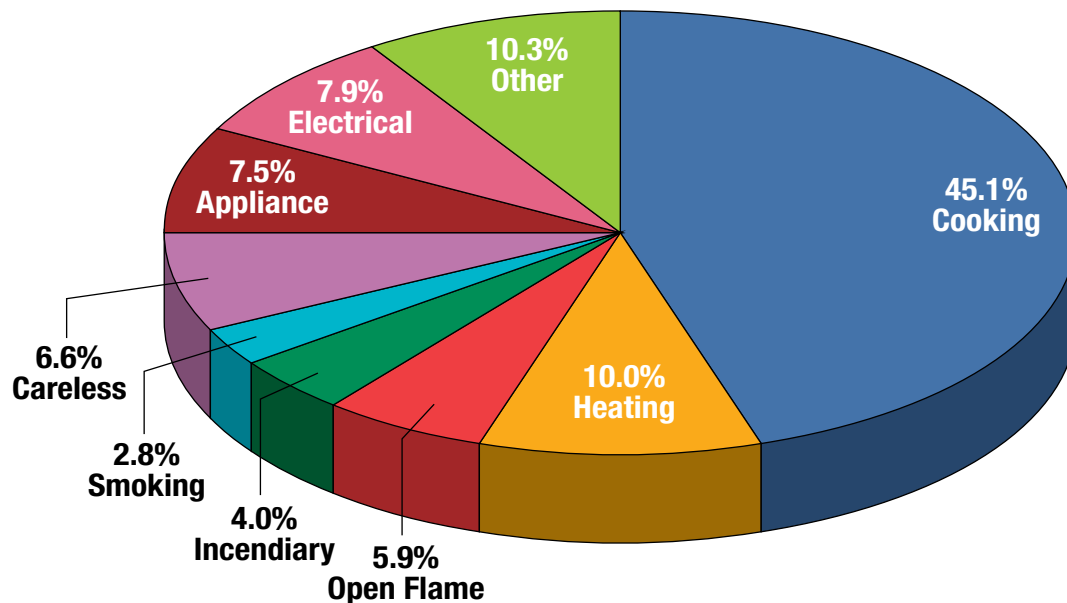

As in past years, cooking continues to be the top cause of fires in Minnesota, with heating as the second leading cause and electrical malfunction as the third leading cause.

Cooking remains the leading cause, mainly due to contained cooking fires.

Fires in residential property represented 77 percent of all structure fires and 52 percent of the total dollar loss.

STRUCTURE FIRE CAUSES

Cooking Fires

The leading cause of structure fires in 2016 was cooking. Ninety-four percent of those fires were contained cooking fires.

The top three known factors in the remaining cooking fires were: unattended equipment at 21 percent, combustibles too close at 13 percent, and equipment turned on accidentally/not turned off at 12 percent. There were no cooking-related civilian fire deaths but 27 civilian injuries, as well as 10 firefighter injuries.

Dollar loss from cooking fires in 2016 totaled \$3,070,163.

Heating Fires

The majority of 2016 heating-related fires (275) occurred in residential properties.

The total number of these fires dropped 3 percent from last year — there were 283 heating-related fires in 2015 — and dollar loss decreased by 17 percent.

SUMMARY

Cooking caused the largest percentage of structure fires. Fires in residential spaces represent 77 percent of all structure fires and 94 percent of fire deaths in structures. While careless smoking accounts for only 3 percent of structure fires, it caused 25 percent of known fire fatalities.

Ten percent of all reported fire causes were listed as “other.” Fire departments should provide the maximum available information on MFIRS reports. In order to focus our fire prevention efforts where the greatest need exists, complete reporting is essential.

Minnesotans continue to be in the greatest danger from fire in their own homes. Fire prevention efforts in the areas of cooking and heating must continue to be a top priority.

Fire Prevention Week

Since 1925, the week of Oct. 9 has been designated Fire Prevention Week in the United States in memory of the Great Chicago Fire of Oct. 9, 1871. The SFMD urges Minnesota fire departments to implement the safety theme and lead fire prevention efforts in their communities.

INCENDIARY FIRES

THIS FIRE SUSPECTED TO BE A RESULT OF:

ARSON

Hot-Line
1-800-723-2020
Rewards Offered

Rewards Of Up To \$2,500 For
Information Leading To The Identification
Of Persons Responsible For This Fire

Minnesota Arson Reward Project - IAAI

There were 828 identified incendiary fires in 2016, an 11 percent decrease from 2015.

Incendiary refers to any intentionally set fire. An arson fire is an example of an incendiary fire, but not all incendiary fires are arson. Incendiary fires may also include recreational fires intentionally set that get out of control. The value of property destroyed by incendiary fires in 2016 was nearly \$6 million, a 32 percent decrease from 2015. Both numbers are considerably lower than those in the 1990s.

In 2016, “Incendiary” was listed as the cause of 4 percent of all reported structure fires with known causes and 5 percent of all reported vehicle fires in Minnesota.

Vehicle incendiary dollar loss represented 3 percent of total vehicle fire dollar loss with an average dollar loss per incendiary vehicle fire of \$4,976.

Fire investigators agree that incendiary vehicle fires are under-reported and may not receive as much attention as structure fires receive.

INCENDIARY STRUCTURE AND VEHICLE FIRES

SUMMARY

Incendiary fires decreased in 2016 and dollar loss for these fires also decreased. Incendiary fires were the cause of 4 percent of structure fires with known causes.

In 2016, 59 percent of all incendiary structure fires were in residential property as well as 50 percent of all incendiary dollar loss.

In the past 28 years, incendiary fires caused 67 deaths and more than \$372.2 million in property loss.

Incendiary fires must continue to be addressed through such efforts as the Arson Reward Program and the Youth Firesetter Intervention and Prevention Program.

Arson Tip Line

Do you have a tip or information about a possible arson fire? Call the Arson Hotline at 1-800-723-2020.

Rewards are possible for information leading to the identification of persons responsible.

Rewards are as follows:

- An extraordinary reward of \$2,000 to \$5,000 for information or assistance that leads to the arrest of person(s) on a charge of arson.
- An information reward of up to \$2,000 for information in a meritorious situation with no requirement that the information lead to an arrest.
- A lesser reward for useful information which could prevent an incendiary fire or aid in catching a person who set one. There is no requirement that the information lead to an arrest.

CASUALTIES

Structure Fires, New Risks and Fire Deaths

Each year, we dedicate a few pages in the Fire in Minnesota report to look at some of Minnesota's fire trends. Here is some of the good news and bad news from 2016.

The fire loss data did not change significantly from 2015 to 2016. The total number of fire department incidents was up about 6 percent, while the total number of fires was down about 6 percent. Most of the decrease in fires occurred in the category of "other" fires, which includes grass fires, trash fires, wildland fires, and outdoor storage fires.

Structure fire rate

Minnesota has been part of the National Fire Incident Reporting System (NFIRS) since the late 1970s. One thing we watch very closely is the number of structure fires; this is because most of the state's fire deaths and the highest percentage of dollar loss comes from structure fires. Over the past few decades, the structure fire rate has been declining; the structure fire rate is the number of fires per 10,000 people, and it is a more accurate

reflection of the fire problem than merely counting the number of structure fires.

The structure fire rate in 2016 (11.1 structure fires per 10,000 population) is about 25 percent lower than what Minnesota experienced in the 1980s (when it was 15.1 structure fires per 10,000 population).

New fire safety risks

Although the overall downward trend in structure fire rates in Minnesota is a good thing, we are starting to see an increase in new fire risks, which may result in a change to this downward trend. People are always coming up with processes that introduce new fire safety hazards. Some of these risks are from materials that burn hotter or faster than the items that they replaced. Others are new

STRUCTURE FIRE RATE (per 10,000 population)

ignition sources that were not present in the past. Here is a list of some of these fire safety hazards:

- **Lasers.** The use of lasers is becoming more common — especially in medical procedures and manufacturing processes. The laser is a source of concentrated radiant heat — often enough to ignite ordinary combustible materials.
- **Lithium ion batteries.** By now most of us have heard about the lithium ion (Li-ion) battery issues in certain smartphones and hoverboards. Lithium is a water-reactive substance, meaning that it can start burning when exposed to water — including the moisture normally present in air. Because water is often used to put out fires, Li-ion batteries present unique firefighting challenges.
- **Marijuana extraction.** Many states — including Minnesota — have legalized medical marijuana. Very flammable gases, such as hexane and butane — are used to extract the oil from the marijuana plants. A single small spark can easily ignite these flammable gas vapors.
- **Plastics.** Plastic materials, when ignited — especially foam plastics — tend to burn hotter and faster than ordinary cellulosic materials, such as wood and paper. For years chemicals were added to plastics to make them resistant to burning, but many of these chemicals are known carcinogens, and their use is falling out of favor.
- **Flammable refrigerants.** For years most refrigerants were non-flammable and were difficult to burn. Unfortunately, many of these refrigerants had negative environmental consequences (some were known to deplete the ozone layer surrounding the planet). The move is to replace these refrigerants with materials that are flammable, known as hydrocarbon refrigerants. Examples include propane and isobutane.

Fire deaths

Minnesota has made significant strides in reducing the annual number of fire deaths. In the 1970s Minnesota averaged 96 fire deaths per year with a fire death rate of 24.5 per million people. In this decade, the average number of fire deaths per year is 49 (about half of what it was in the 1970s) and there were only 8.8 fire deaths per million people.

Although this decrease is a good thing, the fire death rate since 2000 has remained fairly flat, indicating that the progress in reducing fire deaths that was seen through the 1980s and 1990s has likely plateaued. If Minnesota is to continue to lower its fire death rate, more emphasis needs to be placed on the purest form of fire safety: preventing the fire's ignition from occurring.

Failures

Some fire safety experts look at each building fire, fire casualty and fire death as a failure. It was a failure to prevent the fire from starting, a failure to recognize the fire's danger, or a failure to take steps to prevent the fire from growing while escape was still possible.

Those working in public safety see the human side of these events: It is somebody's home, somebody's business, or somebody's loved one who is hurt or killed. Fire departments cannot be the only ones providing fire protection; everyone must do their part to protect their homes, businesses and loved ones from the devastation of fire.

Fire in Minnesota 2016 provides a snapshot of Minnesota's fire loss. It also looks at trends and potential new fire risks. It is intended to give people information and tools that they can use to enhance their own fire safety.

Fire Deaths and Smoke Alarm Performance

In 2016, 43 civilians lost their lives in Minnesota fires. In 33 percent of the residential casualties, smoke alarms were absent or non-operating. In 42 percent of residential fires, it was not possible to determine whether a smoke alarm was present or operating.

FIRE DEATHS AND SMOKE ALARM PERFORMANCE			
Circumstance	Fatalities	% of Dwelling Fires	% of Total Deaths
No Smoke Alarms Present	3	10%	7%
Inoperable Smoke Alarms Present	7	23%	16%
Working Smoke Alarms Present	4	13%	9%
Unknown If Alarms Present/Working	13	42%	30%
Not a Factor/Suicides, Explosions, etc.	4	13%	9%
TOTAL DEATHS IN DWELLINGS	31	100%	71%
Other Fire Deaths (Including vehicles, outdoors, other structures, etc.)	12		28%
TOTAL FIRE DEATHS	43		100%

Four Deaths in Homes with Working Smoke Alarms: Why Didn't They Get Out?

- Intoxication/Drug Use: 1
- Medical issue: 2
- Smoking with oxygen tank nearby: 1

Civilian Fire Deaths

Thirty-seven percent of fire deaths in 2016 occurred between the hours of midnight and 6 a.m. Forty-two percent of the fire deaths occurred in January through April.

The number of people killed in fires in the 0-19 age category and the 60-plus age category decreased from 2015 to 2016. Four people ages 0-19 died in fires in 2016 — a 56 percent decrease. Sixteen people ages 60 and over died last year — a 38 percent decrease.

CIVILIAN FIRE DEATHS BY AGE

Civilian Deaths: 1990 through 2016

In the past 27 years, 1,366 Minnesota civilians have died in fires (see distribution by county on the next page). In 2016, 45 percent of our state population lived in greater Minnesota, where the per capita fire death rate was 1.13 deaths for every 100,000 people. The per capita fire death rate for the metro area in 2016 was 0.49 per 100,000, while the rate for the state as a whole was .78 per 100,000. That is slightly below the national per capita fire death rate, which was 1.09 per 100,000. There are three Minnesota counties that have remained fatality free for the past 27 years: Traverse, Stevens and Murray.

CIVILIAN FIRE DEATHS SINCE 1990 (1,366 TOTAL)

CIVILIAN FIRE DEATHS BY COUNTY SINCE 1990 (1,366 TOTAL)

30-Plus Years of Fire Death History

As Minnesota’s population has grown from 3.8 million in 1970 to 5.5 million in 2016, fire deaths have decreased. During the 1980s, fire deaths in Minnesota dropped 19 percent from the levels of the 1970s. The 1990s showed a further decrease of 25 percent from the levels of the 1980s. The 2000s had a decrease of 21 percent from the 1990s.

Much of this decline in the fire death trend can be attributed to fire service advancements. Since the mid-seventies, the promotion of fire protection technology (smoke alarms, sprinkler systems, etc.) has become widespread in Minnesota.

Also during this time, the state has mandated new inspection and code enforcement programs targeting hotels, motels, schools, and health and day-care facilities.

FIRE DEATHS THE PAST 30+ YEARS

Firefighter Deaths

No Minnesota firefighters died in the line of duty last year but 17 have lost their lives since 1996.

In 2016, 69 on-duty firefighter deaths occurred in the United States. This is the fifth year of the past six that the total number firefighter deaths has been under 70. We honor those who have fallen and remember them with pride and gratitude for their dedicated service in protecting their fellow citizens.

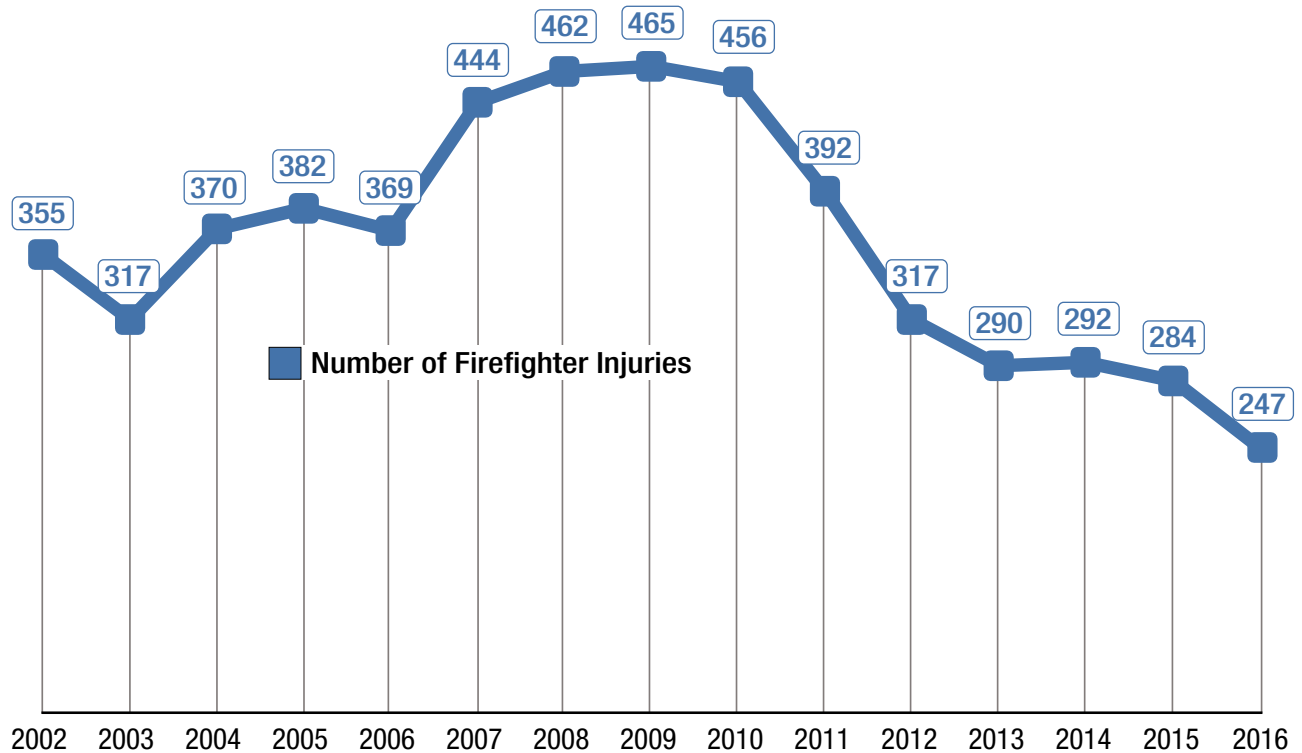

MINNESOTA FIREFIGHTER LINE OF DUTY DEATHS 1996 – 2016

Year	Name Of Firefighter	City
1996	Melvin Windschitl	Chanhassen
1997	Harvey Chlian	Starbuck
1997	Leroy Swanson	Minneapolis
1998	Michael Wiborg	Chanhassen
1999	Marvin Huisman	Wilmont
1999	William Myers	St. Anthony
2002	Kim Granholm	Esko

2013	Matthew Frantz	Rice Lake
2015	Shane Clifton	St. Paul

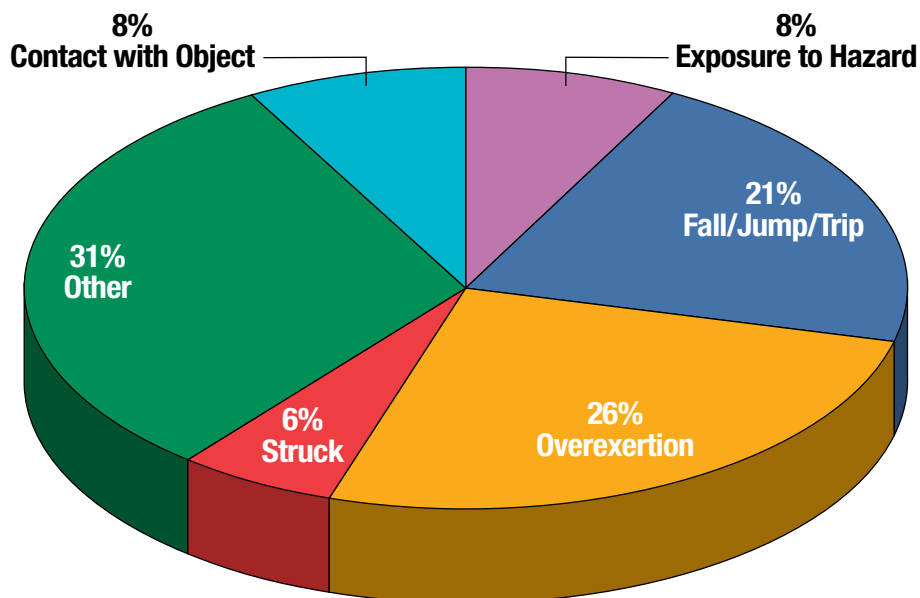

Firefighter Injuries

In 2016, 247 Minnesota firefighters were injured on the job — a slight decrease from 2015. Of these injuries, 111 (45 percent) were fire-related. Seventy-seven percent of these fire-related injuries occurred while firefighters were fighting residential structure fires (85). Of known causes, “overexertion” was the most common (26 percent) with fall/jump/trip as the next highest at 21 percent.

FIREFIGHTER INJURIES

CAUSES OF FIREFIGHTER INJURIES

Fireworks Property Loss

The State Fire Marshal Division has gathered information about fireworks injuries and property damage since 1989. Minnesota hospitals voluntarily report injuries treated in their emergency departments during the period of June 25 through July 15 each year.

Property damage information is taken from the Minnesota Fire Incident Reporting System. From 1989 through 2001, a total of \$1.6 million in property damage resulting from fireworks use was reported, averaging more than \$123,000 per year. The total property damage due to fireworks use from 2002 through 2004 was over \$3 million. Property damage reported from 2007 through 2016 totaled over \$3.1 million, averaging over \$319,150 per year.

^{††} \$1.3M vehicle storage fire in Zumbrota, MN.

Fireworks Injuries

Fireworks injuries most commonly occur to males between 10 and 29 years of age, with burns being the most common type of injury reported. Burn injuries include those to the extremities, eyes and face. It is impossible to know how many injuries occurred for which medical attention was not sought. Approximately 85 percent of Minnesota hospitals participate in the survey of fireworks injuries.

* Information collected from survey conducted at Minnesota hospitals from June 22 through July 15 each year.

** There were two injuries in 2007, two injuries in 2008, one injury in 2011, one injury in 2015 and one injury in 2016 that listed age as “unknown” or “0.”

† There was one fire death from fireworks in 2015.

SUMMARY

Historically, Minnesotans have been at greatest risk of fire death and injury in their own homes. In 2016, 67 percent of fire deaths and 79 percent of civilian injuries occurred in residential settings. Ninety-four percent of structure fire deaths were in residential property. The presence or absence of working smoke alarms is often a factor in fire fatalities. In 33 percent of fire deaths occurring in dwellings, smoke alarms were not present or not working. In 42 percent of residential deaths, it was not known whether alarms were present or functioning.

Careless smoking was the leading cause of fire deaths in 2016 with seven fire deaths. Alcohol or drug use was an impairing factor in 35 percent of all fire deaths.

Forty-five percent of firefighter injuries took place while fighting fires; 77 percent of these fire-related injuries occurred at residential structure fires.

Overall, fire deaths have decreased over the past 30 years in Minnesota, even as the population has grown. However, many preventable tragedies continue to occur. Prevention and education efforts, particularly those targeting vulnerable populations, are essential to reduce losses from fire.

A firefighter in full gear, including a red helmet and yellow jacket, is using a rake to clear a path in a wooded area. The firefighter is wearing a blue backpack and is focused on the task. In the background, another firefighter is visible, working on a pile of debris. The scene is set in a wooded area with trees and a path. The word "PARTICIPATION" is overlaid in large, bold, red letters with a white outline.

PARTICIPATION

Minnesota Fire Incident Reporting System

The Minnesota State Fire Marshal Division appreciates the efforts of the fire departments that submitted data via the Minnesota Fire Incident Reporting System (MFIRS) in 2016.

This information is essential if we are to understand and effectively combat the fire problem in Minnesota. It allows the division to focus on real fire problems, rather than popular perceptions. On the local level, this data provides information to help focus on prevention efforts; it also assists with budget planning for staffing and equipment.

Fire data is requested on a weekly basis by the media, the public the fire service, and the

fire protection community. It is used to support legislative initiatives and to guide public fire/safety campaigns.

Information about reporting departments is listed on the following pages. In 82 counties last year, 100 percent of the fire departments reported via the MFIRS system.

In some instances, the protection district of the reporting fire department goes beyond its county boundary, but the incident is recorded within the department's home county. The fire rate equals one fire per number of persons indicated. For example, in Aitkin County in 2016, there was one fire for every 334 people.
